

Exercise 15

HTML RADIO BUTTONS

They're called "radio buttons" because they act similarly to the radio preset tuning buttons on cars

In Exercise 13, you learned a little about HTML checkboxes. In this exercise, let's learn a little about a sibling: *radio buttons*.

First, run the repl for this exercise to see what radio buttons look and behave like. As you click on any one button, any previously-selected button will be *deselected*. In order to make this work, all the buttons in a group must share the same `name` attribute. Labels act just as they did in checkboxes, where the `for` attribute must match the `id` attribute of the checkbox.

□ Try it yourself, adding 3 more flowers to the named `flower` group.
