

Exercise 25

BUILDING A NAVIGATION BAR

Navigation bars are commonly employed on websites. We're going to build one that looks like this:

About Us

- ❑ You can try it now by running the repl. Mouse over the various links. Click on them to see what happens. Then check out the HTML for each of the pages, paying particular attention to the **active class** that is set on different `<a>` elements, depending on the current or *active* page.
- ❑ Look over the CSS I provided. Try using different values for various rules and see how that affects the styling of the elements.
- ❑ Got all that? Great! Now wipe out everything in **index.css**! *What?!* Don't worry: it's all there in **answer.css**, which you can always copy/paste back into **index.css**, so you don't have to be afraid you'll permanently screw it up. But this is a great way to learn how to write CSS — by trying to recreate a previously-existing page (which is what you should do now).
- ❑ Also, I created two other HTML files: **faq.html** and **schedule.html**. Use those to add `<nav>` children to the other HTML files.
