

# Exercise 57

Rev. 1Aug2019

***MORE CSS FUN***

People who are really good at CSS look at my work, pat me on the head, and say, "Yeah, that's not...bad!" —● Another fun project. This is what I'm after:

at CSS look at my work,  
pat me on the head, and  
say, "Yeah, that's  
not...bad!"

Of course, you can change the text, font, and color:

Once again, the focus is on CSS; the JavaScript is minimal, with nothing new. The one new CSS technique is the overlay of text on an image. This is done by means of making the CSS position of `#sampleText` set to `relative`. Elements with a position of *relative* allow the rules of `top`, `bottom`, `left`, and `right` to alter the element's position *relative* to where it would normally be positioned.

Try changing the values for `position` and `top` for `#sampleText` to see what effect these have. Also, for a top-notch visual explanation of how positioning works, check out <http://www.barelyfitz.com/screencast/html-training/css/positioning/>.
